

meta-instruction for optimization

I'm trying to write a zero-shot prompt which consists of four parts.

My current prompt is:

```
[{prompt_to_revise}]
```

But it gets the following outputs that fail to match the expected outputs:

```
{failed_cases}
```

The sentence I want to revise is:

```
{sentences[chosen_sentence]}
```

Comparing the wrong outputs with their corresponding expected answers under the same input, optimize the above sentence to help AI understand the task more comprehensively and accomplish this task better.

Your response format is as follows.

The given sentence

'{sentences[chosen_sentence]}' should be revised as:
